You pick through [@kelseyhightower](#)'s GitHub until you find a small repo with a tutorial and demo code. That's mostly what I do...

Oh it's simple - ``serverless create --template kubernetes``

Though this will spin up 6 pods on 120 different nodes so you'll need a lots of machines. Lucky it's server-less and not server-not-at-all.

I think you have to be wearing dockers.

Easy: 1 DevOps consultant for the kubernetes part, 1 serverless hero for the serverless part, 1 agile coach to supervise, 1 management executive to shout buzzword nonsense for motivation + leadership, and 1 dev team to serve as drinking buddies the whole time.

Very simple. Split all into very small functions, coordinate with Step Functions. It will take just about a year to refactor. Then somewhere between one and ten years to debug. By the time it's done, all the cool trends will be different. Rinse, repeat.
